

In this project I have used MVC architecture.

I am using **Tomcat V10.1** as server

And I have used the concept of connection pooling for optimized database connections.

Steps to follow for connection pooling:

1. Press ctrl+shift+r in eclipse IDE and search for context.xml file for tomcat v10.1

2. Open context.xml and paste below line between context tags

```
<Resource name="myds" auth="Container" maxIdle="20"
type="javax.sql.DataSource" driverClassName="com.mysql.cj.jdbc.Driver"
url="jdbc:mysql://localhost/learnersacademy" username="root"
password=""/>
```

3. In the above line change username with your database username and password with your database password.
4. Also before running project run the attached sql file to create database and tables

learnersacademy.sql
